

## ABSTRACT OF THE DISCLOSURE

A software application streamed from a host system to a target system comprises the installation or configuration logic for another software application. In certain embodiments, the installation logic conforms to a well-known installation standard. The described technique allows the use and/or execution of installation logic or other related objects when these objects do not exist in their entirety on the target system. The application installation that results from this process may configure the subsequent application to be delivered only in part (in streamed mode) or in its entirety.
